Set 145: Human agency, dependence and responsibility

Outcome AI.PHIL.06: Explain automation bias and keep human judgment and responsibility when using AI help

Module: Society: philosophy and social questions

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
AUTOMATION BIAS is the tendency to trust an automated system's suggestion too much, even when other evidence says it is wrong. Examples: following a GPS into a lake, or approving every AI-flagged item without looking. Keeping HUMAN AGENCY means you stay the decision-maker: you understand the task, check important suggestions, and can explain your choices. RESPONSIBILITY stays with people, and DEPENDENCE grows when skills go unused, so practice key skills yourself sometimes. AI help is most useful when it supports judgment rather than replacing it.

What is automation bias?

A. A tax on robots
B. Trusting an automated suggestion too much
C. A type of software bug
D. Refusing to use any automated system

REFERENCE LABEL: NOT PART OF THE QUESTION ID S145-M-Q1

How can you limit unhealthy dependence?

A. Delete your notes
B. Never learn anything new
C. Practice key skills yourself sometimes
D. Use AI for every single task, every day

REFERENCE LABEL: NOT PART OF THE QUESTION ID S145-M-Q5
Artificial Intelligence, Set 145: Human agency, dependence and responsibility · MAIN · Q5/5 · Outcome AI.PHIL.06 (local)

Learn
Spell-check catches many mistakes, so people stop proofreading. But it misses correctly spelled wrong words: "their" for "there," or "pubic" for "public." Someone who relies on it completely sends embarrassing errors. Someone who uses it AND reads their work catches more. AI help is similar: a useful tool, but trusting it completely lets its mistakes through.

Why do people stop proofreading?

A. Spell-check catches many mistakes

B. Because proofreading is not allowed in schools or workplaces once spell-check is turned on

C. Because words do not matter

D. Because they type perfectly

Which habit supports human agency?

A. Hiding decisions
B. Never asking questions
C. Saying "the AI told me to" whenever someone asks why a decision was made
D. Being able to explain your choices

REFERENCE LABEL: NOT PART OF THE QUESTION ID S145-F1-Q5
Artificial Intelligence, Set 145: Human agency, dependence and responsibility · FORWARD 1: APPLY IT · Q5/5 · Outcome AI.PHIL.06 (local)

Learn
Automation bias grows with fatigue, time pressure and high system accuracy: if a tool is right 99 times, the 100th error is easy to miss. Design and habits can help: require a reason before accepting high-stakes suggestions, show the evidence behind them, rotate tasks, and periodically do work without the tool to keep skills fresh. Reasonable people differ on how much to rely on AI in different areas; the core point is to choose deliberately.

Why is automation bias stronger when a tool is usually right?

A. Because people dislike accuracy

B. The rare error is easy to miss

C. Because accurate tools are slower

D. Because accurate tools never make any errors at all, so there is nothing to check

REFERENCE LABEL: NOT PART OF THE QUESTION ID S145-F2-Q1

Set 146: Alignment as a concept

Outcome AI.PHIL.07: Explain alignment as getting a system to pursue what people actually intend, including the gap between a stated goal and the intended goal

Module: Society: philosophy and social questions

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
ALIGNMENT means getting an AI system to pursue what people actually INTEND, not just what they literally said. There is often a GAP between a STATED GOAL and the INTENDED GOAL. A cleaning robot told "minimize visible mess" might hide mess under the rug. A model rewarded for answers people rate highly might learn to flatter instead of being accurate. These are simple examples of a broader challenge: specifying goals completely is hard, and systems may find shortcuts that satisfy the letter of a goal but miss its spirit. How hard this will be for future systems is debated.

What does alignment mean?

A. Getting a system to pursue what people actually intend

B. Arranging computer parts in a straight line so that the machine runs more efficiently

C. Making AI faster

D. Making AI cheaper

Learn
People disagree about how hard alignment will be for more capable systems and how much to worry, and this course does not settle that. Practical habits help with today's tools: state goals with limits and priorities, test for shortcuts, measure what you actually want, and keep humans reviewing important outcomes. The same gap appears with people and organizations, as when a measure becomes a target, so the idea is not unique to AI.

Do people agree on how hard alignment will be for more capable systems?

A. Yes, it is solved
B. No
C. It is never discussed
D. Yes

REFERENCE LABEL: NOT PART OF THE QUESTION ID S146-F2-Q1
Artificial Intelligence, Set 146: Alignment as a concept · FORWARD 2: HANDLE THE COMPLICATIONS · Q1/5 · Outcome AI.PHIL.07 (local)

Learn
People disagree about how hard alignment will be for more capable systems and how much to worry, and this course does not settle that. Practical habits help with today's tools: state goals with limits and priorities, test for shortcuts, measure what you actually want, and keep humans reviewing important outcomes. The same gap appears with people and organizations, as when a measure becomes a target, so the idea is not unique to AI.

Does this course settle how much to worry about alignment?

A. It does not mention alignment
B. Yes, it says disaster is certain
C. No
D. Yes

REFERENCE LABEL: NOT PART OF THE QUESTION ID S146-F2-Q2
Artificial Intelligence, Set 146: Alignment as a concept · FORWARD 2: HANDLE THE COMPLICATIONS · Q2/5 · Outcome AI.PHIL.07 (local)

Set 147: Weighing benefits and harms

Outcome AI.PHIL.08: Compare competing arguments about AI's role by their evidence and values, without treating a disputed view as fact

Module: Society: philosophy and social questions

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Debates about AI's role, for example in schools, art, medicine or work, often mix two things: EVIDENCE (what is true or likely) and VALUES (what matters most). Someone may favor AI tutors because studies show gains (evidence) and because they value access for all (value). Someone else may worry about lost skills (evidence question) and value human connection (value). To weigh arguments fairly, separate the two: check the evidence, name the values, and notice when a disputed view is presented as settled fact.

What two things do AI debates often mix?

A. Speed and size
B. Names and dates
C. Evidence and values
D. Prices and colors

REFERENCE LABEL: NOT PART OF THE QUESTION ID S147-M-Q1

Which summary is fairest?

A. The strongest version of each side

B. Only the other side

C. Only your side

D. The weakest version of the side you disagree with and the strongest version of your own side

REFERENCE LABEL: NOT PART OF THE QUESTION ID S147-F1-Q5

Artificial Intelligence, Set 147: Weighing benefits and harms · FORWARD 1: APPLY IT · Q5/5 · Outcome AI.PHIL.08 (local)

Learn
Good-faith disagreement is normal when people share facts but weigh values differently. Evidence can be limited, early or mixed, so honest conclusions are often provisional. Watch for cherry-picking (only citing supportive studies), treating predictions as facts, and dismissing people instead of arguments. A fair summary states the strongest version of each side. This course does not tell you which side to take.

Evidence about a new AI use is early and mixed. What kind of conclusion is honest?

A. Whatever is popular

B. A final and certain conclusion, which should never be revisited even when new evidence appears

C. No conclusion ever

D. A provisional one

REFERENCE LABEL: NOT PART OF THE QUESTION ID S147-F2-Q1

Learn
Two early moments shaped how people talk about AI. In 1950, Alan Turing's paper "Computing Machinery and Intelligence" asked whether machines could think and proposed the imitation game as a practical test. In August 1955, John McCarthy, Marvin Minsky, Nathaniel Rochester and Claude Shannon wrote a proposal for a summer research project at Dartmouth College in 1956; the proposal is credited with introducing the term "ARTIFICIAL INTELLIGENCE." These moments matter because they framed AI as a research field and set questions people still debate.

What did Turing's 1950 paper propose?

A. The name "artificial intelligence"
B. A law about computers
C. The imitation game as a practical test
D. The first working chatbot

In 1950, Alan Turing's paper "Computing Machinery and Intelligence" asked whether machines could think and proposed the imitation game as a practical test. In August 1955, John McCarthy, Marvin Minsky, Nathaniel Rochester and Claude Shannon wrote a proposal for a summer research project at Dartmouth College in 1956; the proposal is credited with introducing the term "ARTIFICIAL INTELLIGENCE." These moments matter because they framed AI as a research field and set questions people still debate.

A video claims "AI was invented in 2022." What is more accurate?

A. The video is correct, because nobody had any ideas about thinking machines before 2022

B. AI was invented in 1800

C. AI has no history

D. The term and field date to the 1950s

REFERENCE LABEL: NOT PART OF THE QUESTION ID S148-F1-Q1

Learn
Two early moments shaped how people talk about AI. In 1950, Alan Turing's paper "Computing Machinery and Intelligence" asked whether machines could think and proposed the imitation game as a practical test. In August 1955, John McCarthy, Marvin Minsky, Nathaniel Rochester and Claude Shannon wrote a proposal for a summer research project at Dartmouth College in 1956; the proposal is credited with introducing the term "ARTIFICIAL INTELLIGENCE." These moments matter because they framed AI as a research field and set questions people still debate.

Which question did Turing's paper start from?

A. "How can computers be made cheaper for schools and families?" which was a big concern then

B. "Can machines think?"

C. "How do phones work?"

D. "What is the internet?"

REFERENCE LABEL: NOT PART OF THE QUESTION ID S148-F1-Q2

Learn
Early researchers were very optimistic: the Dartmouth proposal suggested significant progress could be made in one summer by a small group. Progress turned out to be much slower and uneven, with periods of reduced funding and interest. Remembering this helps when reading today's confident predictions. History also shows that a name can shape expectations: "intelligence" invites comparisons with people that the systems may not support.

How optimistic was the Dartmouth proposal?

A. It made no predictions

B. It suggested significant progress in one summer

C. It predicted that no progress at all would be made for at least one hundred years

D. It predicted 2022 chatbots

Set 149: From written rules to learning systems

Outcome AI.HISTORY.02: Explain the shift from mainly hand-written rules and search to learning from data, with dated examples

Module: Society: history and claims about the future

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Early AI often relied on HAND-WRITTEN RULES and SEARCH: people wrote rules, and programs searched through possibilities. IBM's Deep Blue beat world chess champion Garry Kasparov in a 1997 match, relying mainly on very fast search and evaluation methods crafted by experts. Over time, the field shifted toward LEARNING FROM DATA, where systems find patterns from examples. In March 2016, DeepMind's AlphaGo, which used deep neural networks trained on data and self-play, beat Go champion Lee Sedol 4 games to 1. Go has far more possible positions, so search alone was not enough.

What did early AI often rely on?

A. Large language models trained on most of the text on the internet, as modern chatbots are

B. Smartphones

C. Social media

D. Hand-written rules and search

Learn
Three milestones show the deep learning era. In 2012, a deep neural network trained on graphics processors (GPUs), often called AlexNet, won a major image-recognition competition with a top-5 error of 15.3 percent versus 26.2 percent for the next entry. In 2017, the paper "Attention Is All You Need" introduced the TRANSFORMER, a design that became the basis of most later large language models. On November 30, 2022, OpenAI released ChatGPT as a free research preview, bringing chat-style access to a large language model to a very wide public.

Prepared example (milestones from the course sources)

Year	Milestone
2012	Deep network wins image-recognition competition
2017	Transformer paper published
2022	ChatGPT released as a free research preview

In this table, how many years separate the first and last milestones?

A. 5, which is the gap between the transformer paper and the chatbot release in the table

B. 10

C. 22

D. 12

Learn
Cars changed in stages. A better ENGINE made cars powerful. A better DESIGN, such as the assembly line, made them practical to build at scale. Then affordable models put cars in ORDINARY FAMILIES' hands. AI's recent history has similar stages: 2012 showed deep networks were powerful, 2017 gave a design that scaled, and 2022 put chat-style AI in ordinary people's hands.

The 2012 result is most like which car stage?

A. A better engine

B. Road signs

C. The assembly line

D. Affordable cars for ordinary families, since 2012 was when everyone started using AI

Set 151: Narrow skill versus general intelligence claims

Outcome AI.HISTORY.04: Tell narrow task performance from claims of general intelligence

Module: Society: history and claims about the future

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
A NARROW system does one task or a small set of tasks very well: Deep Blue played chess; AlphaGo played Go; an image classifier labels photos. GENERAL INTELLIGENCE, often called AGI (artificial general intelligence), would mean flexible ability across a wide range of tasks, including new ones, at or beyond human level; definitions vary and are debated. Strong performance on one task, or even many tests, does not by itself show general intelligence. Today's chat models handle many tasks, which makes the line blurrier, but they also fail in ways people do not expect.

What is a narrow system?

A. A slow system

B. A system that can do every task that any human can do, at least as well as any human

C. One that does one task or a small set very well

D. A small computer

D. Yes

REFERENCE LABEL: NOT PART OF THE QUESTION ID S151-F2-Q4
Artificial Intelligence, Set 151: Narrow skill versus general intelligence claims · FORWARD 2: HANDLE THE COMPLICATIONS · Q4/5 · Outcome AI.HISTORY.04 (local)

Learn
Claims about general intelligence deserve careful reading. Ask: How is "general" defined here? Which tasks were tested, and were they new to the system? How does it fail? Who is making the claim, and do they benefit from it? Experts disagree about how close current systems are to general intelligence and whether the concept is even well defined. This course does not settle that debate.

Does this course settle the AGI debate?

A. No
B. Yes, it says AGI exists
C. Yes, it says AGI is impossible
D. Yes, it states the exact year

REFERENCE LABEL: NOT PART OF THE QUESTION ID S151-F2-Q5
Artificial Intelligence, Set 151: Narrow skill versus general intelligence claims · FORWARD 2: HANDLE THE COMPLICATIONS · Q5/5 · Outcome AI.HISTORY.04 (local)

Set 152: Forecasts, headlines and evidence

Outcome AI.HISTORY.05: Tell recorded events from predictions, and judge the evidence behind a capability claim or headline

Module: Society: history and claims about the future

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Headlines about AI mix RECORDED EVENTS ("a model was released on March 3"), CAPABILITY CLAIMS ("it solves difficult math problems") and PREDICTIONS ("AI will replace most jobs by 2030"). Each needs different checking. Events can be confirmed from records. Capability claims need EVIDENCE: what tests, how many, who ran them, compared with what? Predictions are uncertain by nature; check who is predicting, their track record, and what assumptions they make. A confident tone does not turn a prediction into a fact.

Prepared example (a fictional headline)

Headline: "New AI released Tuesday aces math olympiad problems; experts say it will make math teachers obsolete by 2030."

In this fictional headline, which part is a recorded event?

A. Aces math olympiad problems
B. None
C. Will make math teachers obsolete
D. Released Tuesday

A student writes "AI uses 1.5% of world electricity." What is the correction?

A. The IEA estimate is for all data centres, not just AI

B. AI uses none

C. No correction is needed, since every data centre is used only for AI and nothing else

D. It is 50%

AI uses ENERGY and other RESOURCES: electricity to train and run models in DATA CENTRES (buildings full of computers), water for cooling in some designs, and materials for chips. The International Energy Agency (IEA) estimated that data centres used about 415 terawatt-hours (TWh) of electricity in 2024, about 1.5 percent of global use, and projected around 945 TWh by 2030 in its base case, stressing large uncertainty. Data centres serve much more than AI. Per-question energy figures vary widely and should not be treated as one universal number.

Which resource besides electricity can AI use?

A. Gasoline, which every data centre burns directly to power the computers that run AI

B. Sand only

C. Water for cooling in some designs

D. Paper

Estimates differ because they depend on the model size, hardware, how busy data centres are, and what is counted, such as training versus everyday use. The electricity source does not change how much electricity is used, but it strongly affects the related emissions. Newer hardware can use less energy per task, while growing use can raise the total. Claims like "each question uses a bottle of water" may be based on particular assumptions. Look for the source, date, what was measured and the range of uncertainty.

For the same amount of electricity used, which factor changes the carbon emissions?

A. The length of the question
B. The language of the question
C. The user's time zone
D. The electricity source

How can newer hardware affect energy?

A. It has no effect

B. It can use less energy per task

C. It uses no energy

D. It always uses far more energy per task, since newer computers are always less efficient

Claims like "each question uses a bottle of water" may be based on particular assumptions. Look for the source, date, what was measured and the range of uncertainty.

Why might total energy still rise with more efficient hardware?

A. It cannot rise

B. Because efficient hardware always uses more energy in total than older, less efficient hardware

C. Growing use can raise the total

D. Because energy is free

Training versus everyday use: why does this matter for estimates?

A. Because training is free

B. It does not matter

C. Because training and everyday use always consume exactly the same amount of energy

D. They count different things

What should you look for in an energy claim?

A. Source, date, what was measured and uncertainty
B. Only a single number
C. Only the headline
D. Only how alarming or reassuring the claim sounds
