Set 121: How data can build in bias

Outcome AI.FAIR.01: Explain how unrepresentative or historical data can lead a model to repeat unfair patterns

Module: Society: bias, fairness and access

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Models learn patterns from their TRAINING DATA, so problems in the data can become problems in the model. UNREPRESENTATIVE data leaves some groups out or underrepresents them: a skin-condition tool trained mostly on photos of light skin may work worse on dark skin. HISTORICAL data can carry past unfairness: if a company mostly promoted one group in the past, a model trained on its promotion records may learn to favor that group. The model is not "deciding" to be unfair; it repeats patterns. That is why data choices need careful checking.

Why can problems in training data become problems in a model?

A. Models only use the internet
B. Models learn patterns from the data
C. Data is deleted after training
D. Models ignore their training data

Learn
Imagine learning English only from people in one small town. You would pick up their accent, local slang and habits, and you might struggle to understand people from elsewhere. That is not because other English is wrong; you just never heard it. A model trained on limited or skewed data is similar: it learns what it saw, and does worse on what it rarely saw.

What would you pick up from one town?

A. Every accent and every way of speaking English in the whole world, equally well

B. Nothing

C. Only grammar rules

D. Its accent and local habits

REFERENCE LABEL: NOT PART OF THE QUESTION ID S121-B1-Q1

Learn
Bias can enter at every step, not only in data collection. LABELS can reflect labelers' assumptions. The question a model is asked to predict can be a poor stand-in for what matters: predicting "past arrests" is not the same as predicting "crimes committed," because arrests also reflect where police patrol. Fixing bias is rarely as simple as deleting one column; it usually takes better data, careful goals, testing across groups and ongoing monitoring.

Labelers assume all nurses are women and label photos that way. Where did bias enter?

A. Nowhere

B. In the font

C. In the computer hardware, which adds its own assumptions to every photo label

D. In the labels

REFERENCE LABEL: NOT PART OF THE QUESTION ID S121-F2-Q1

People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
An ERROR RATE is the share of cases a system gets wrong. A system can have a good average error rate but very different rates for different groups, called a DISPARITY. Studies have measured this. "Gender Shades" (Buolamwini and Gebru, 2018) found three commercial gender-classification systems had error rates up to 34.7 percent for darker-skinned women versus at most 0.8 percent for lighter-skinned men. A 2020 study of five speech-recognition systems found an average word error rate of 0.35 for Black speakers versus 0.19 for white speakers. Findings describe those systems at that time.

What is an error rate?

A. The price of errors
B. The speed of a system
C. The share of cases a system gets wrong
D. The total number of people who used the system on a single day

REFERENCE LABEL: NOT PART OF THE QUESTION ID S122-M-Q1

An ERROR RATE is the share of cases a system gets wrong. A system can have a good average error rate but very different rates for different groups, called a DISPARITY. Studies have measured this. "Gender Shades" (Buolamwini and Gebru, 2018) found three commercial gender-classification systems had error rates up to 34.7 percent for darker-skinned women versus at most 0.8 percent for lighter-skinned men. A 2020 study of five speech-recognition systems found an average word error rate of 0.35 for Black speakers versus 0.19 for white speakers. Findings describe those systems at that time.

A tool errs on 2 of 50 cases for Group A and 10 of 50 for Group B. What are the rates?

A. 4% and 20%
B. 8% and 12%
C. 20% and 4%
D. 2% and 10%

A 2018 finding is cited about a system updated in 2025. What is the careful approach?

A. Assume the problem is fixed

B. Look for newer tests

C. Assume the 2018 finding still applies exactly, since systems never change after release

D. Ignore both

REFERENCE LABEL: NOT PART OF THE QUESTION ID S122-F1-Q5
Artificial Intelligence, Set 122: Uneven error rates · FORWARD 1: APPLY IT · Q5/5 · Outcome AI.FAIR.02 (local)

Learn
Describe disparities accurately. Say WHICH systems, WHEN, and WHAT was measured. "Twice the error rate" and "16 percentage points higher" can describe the same gap in different ways; choose the clearer one and give the numbers. Avoid overstating ("all AI is biased against X") or dismissing ("it is fixed now") without new evidence. Systems change, so newer tests may show smaller or larger gaps.

Which statement overstates a finding?

A. "In this 2020 study, five systems had higher error rates for one group of speakers."

B. "Newer tests may differ."

C. "All AI is biased against this group."

D. "The tested system erred more for Group B."

Set 123: Proxy variables

Outcome AI.FAIR.03: Recognize a proxy (an input that stands in for a protected trait) in a simple example

Module: Society: bias, fairness and access

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
A PROXY is an input that stands in for something else. In fairness, the concern is a proxy for a PROTECTED TRAIT, such as race, sex, age or disability, that anti-discrimination rules protect. Removing the trait itself does not prevent bias if a proxy remains. ZIP code can stand in for race in places where neighborhoods are segregated; a gap in employment history can stand in for caregiving and therefore sex. One example in law: Illinois amended its Human Rights Act, effective January 1, 2026, so employers may not use ZIP codes as a proxy for protected classes in AI-assisted employment decisions.

What is a proxy in this context?

A. A password
B. A computer server
C. An input that stands in for something else
D. A person who votes for someone else

Learn
"Fair" can mean different things, and the meanings can CONFLICT. One goal: EQUAL ERROR RATES, so each group faces the same chance of being wrongly flagged. Another: EQUAL SELECTION RATES, so each group is approved at the same rate. Another: CALIBRATION, where a score of "70% likely" means the same thing for every group. Researchers have shown that, when groups differ in underlying rates, these goals usually cannot all be met at once. So choosing a fairness goal is a DECISION about values that people must make and explain, not a purely technical setting, and which goal fits best is debated.

What does "equal error rates" aim for?

A. The same chance of being wrongly flagged in each group
B. Faster answers
C. No errors at all
D. Exactly the same number of people approved in each group

Artificial Intelligence, Set 124: Different fairness goals · BACKWARD 1 (concept simplification) · Q3/5 · Outcome AI.FAIR.04 (local)

Learn
Splitting a pizza "fairly" among friends can mean different things. EQUAL slices for everyone? Bigger slices for those who are hungrier? Slices based on who paid more? Each is a reasonable idea of fair, and you cannot do all three at once if people differ in hunger and payment. The group has to decide which idea to use, and explain it. AI fairness goals work the same way.

Is any of the three ideas unreasonable?

A. Only equal slices is reasonable
B. Only payment is reasonable
C. No; each is reasonable
D. Yes, all three are unreasonable

REFERENCE LABEL: NOT PART OF THE QUESTION ID S124-B1-Q4

AI fairness goals work the same way.

What is the lesson for AI fairness?

A. There is one correct fairness formula that every AI system should always use
B. Pizza is unfair
C. Fairness does not matter
D. Different goals conflict; people must choose and explain

REFERENCE LABEL: NOT PART OF THE QUESTION ID S124-B1-Q5
Artificial Intelligence, Set 124: Different fairness goals · BACKWARD 1 (concept simplification) · Q5/5 · Outcome AI.FAIR.04 (local)

Learn
"Fair" can mean different things, and the meanings can CONFLICT. One goal: EQUAL ERROR RATES, so each group faces the same chance of being wrongly flagged. Another: EQUAL SELECTION RATES, so each group is approved at the same rate. Another: CALIBRATION, where a score of "70% likely" means the same thing for every group. Researchers have shown that, when groups differ in underlying rates, these goals usually cannot all be met at once. So choosing a fairness goal is a DECISION about values that people must make and explain, not a purely technical setting, and which goal fits best is debated.

A scholarship tool is tuned so each group is selected at the same rate. Which goal is this?

A. No goal
B. Equal selection rates
C. Equal error rates
D. Calibration

REFERENCE LABEL: NOT PART OF THE QUESTION ID S124-F1-Q1

Set 125: One accuracy score can hide problems

Outcome AI.FAIR.05: Explain why an overall accuracy score can hide poor results for some groups or cases, and plan inclusive testing

Module: Society: bias, fairness and access

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn

One overall ACCURACY score can hide serious problems. If a tool is 95% accurate overall, it might be 98% accurate for a large group and only 70% for a small one, because the large group dominates the average. It can also hide poor results on rare but important CASES, such as unusual accents or uncommon medical conditions. INCLUSIVE TESTING breaks results down: by group, by situation and by type of case. It includes enough examples from smaller groups to measure them reliably, and checks the cases where errors would cause the most harm.

Prepared example (fictional results)

Group	Tests	Correct	Accuracy
Large group	900	882	98%
Small group	100	70	70%
All	1,000	952	95.2%

In this prepared example, what is the overall accuracy?

A. 70%

B. 98%

C. 95.2%

D. 84%

REFERENCE LABEL: NOT PART OF THE QUESTION ID S125-M-Q1

Generated text and images can repeat STEREOTYPES: oversimplified ideas about groups. Ask for "a doctor" and get only men; "a nurse" and get only women; "a family" and get only one kind of family; or stories where certain groups always play the same roles. These come from patterns in training data. Spot them by looking across SEVERAL outputs, not just one, and asking: Who is shown? In what roles? Who is missing? Plan HUMAN REVIEW before publishing, especially for content about people, and revise requests to be specific when that serves the purpose.

How should you spot stereotypes?

A. Look across several outputs
B. Only read titles
C. Ask the tool if it is biased
D. Look at one single output

Set 127: Language and disability access

Outcome AI.FAIR.07: Evaluate whether an AI feature works for people with different languages, accents and disabilities, using measured evidence

Module: Society: bias, fairness and access

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
An AI feature is only useful if it works for the people who need it. Check ACCESS across LANGUAGES (does it handle Spanish, Tagalog or Navajo as well as English?), ACCENTS and dialects (does speech recognition understand everyone?), and DISABILITIES (can blind users operate it with a screen reader? does it handle speech differences? are captions accurate?). Use MEASURED evidence, such as error rates per group from testing with real users, rather than assumptions. The 2020 speech study is one example of measuring gaps between groups.

Why check access across groups?

A. For decoration
B. A feature is useful only if it works for those who need it
C. To make it slower
D. Because features always work equally well for every user

Report results honestly, including groups where the feature works poorly.

Who should test an accessibility feature?

A. The people who will use it, including disabled users

B. Only managers

C. Nobody

D. Only the engineers who built it, since they understand how it is supposed to work

REFERENCE LABEL: NOT PART OF THE QUESTION ID S127-F2-Q4
Artificial Intelligence, Set 127: Language and disability access · FORWARD 2: HANDLE THE COMPLICATIONS · Q4/5 · Outcome AI.FAIR.07 (local)

Learn
Access problems are often invisible to the team that built a tool. A voice-only feature excludes people who cannot speak or hear well; a feature that works only in English excludes many users. Offer alternatives, such as typing as well as speaking, and test with the people who will use the feature, including disabled users, paying them for their time where possible. Report results honestly, including groups where the feature works poorly.

What evidence best shows a feature works across accents?

A. A five-star review

B. A press release

C. A short video demonstration in which one speaker with one accent uses the feature successfully

D. Measured error rates per accent group

Set 128: Law, regulation, proposal, ruling, contract or guidance

Outcome AI.LAW.01: Tell a law, a regulation, a proposed bill, a court ruling, a contract and voluntary guidance apart

Module: Society: law, policy and responsibility

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Rules about AI come in different forms with different force. A LAW (statute) is passed by a legislature, such as Congress or a state legislature. A REGULATION is a detailed rule made by a government agency under a law. A PROPOSED BILL is not law until it passes. A COURT RULING decides a case and can guide later cases, depending on the court. A CONTRACT, such as a tool's terms of service, binds the people who agree to it. VOLUNTARY GUIDANCE, such as the NIST AI Risk Management Framework (January 2023), offers advice but is not a law. This course gives general information, not legal advice.

Who passes a law (statute)?

A. A single judge
B. A legislature
C. A news reporter
D. A company that makes AI tools, when it writes the terms that its users agree to

News stories blur these forms. "New AI law!" may describe a bill that has not passed, an agency's draft, or one judge's ruling in a single case. Ask: Who made it? Has it taken effect, and when? Where does it apply? Is it binding, or advice? Rules also change: bills fail, regulations are revised, and higher courts can overturn rulings. Always check the date and current status before relying on a rule.

A news story says "New AI law!" but describes an agency's draft. What is it really?

A. A contract

B. A final law that took effect the moment the agency posted the draft on its website

C. A draft that is not yet final

D. A court ruling

Perlmutter (March 18, 2025), a federal appeals court upheld refusing registration for an image the applicant said an AI made entirely by itself; the Supreme Court declined review in March 2026. The US Copyright Office's January 2025 report said prompts alone generally do not make someone the author, while human-written text and human SELECTION, ARRANGEMENT or MODIFICATION of AI output can be protected. SETTLED: purely AI-generated material is not protected. OPEN: exactly how much human contribution is enough.

Someone types one prompt and gets an image, changing nothing. Per the 2025 report, are they likely its author?

A. Yes, if the image is beautiful
B. Yes, if they paid for the tool
C. Unlikely
D. Certainly

Two Copyright Office examples help. In Zarya of the Dawn (February 2023), a comic's text and the human selection and arrangement of its parts could be registered, but the individual AI-generated images could not. Its March 2023 guidance asks applicants to disclose AI-generated material that is more than minimal and claim only the human-authored parts. Other countries have their own rules. Courts may still refine where the line falls, so check the current status.

Per the March 2023 guidance, what should a US registration applicant disclose?

A. Their age

B. Their computer brand

C. More-than-minimal AI-generated material

D. Nothing, since AI use never needs to be mentioned to the Copyright Office in any application

Set 130: Training data and copyright: still unsettled

Outcome AI.LAW.03: Describe the open legal questions about training AI on copyrighted works without presenting them as settled

Module: Society: law, policy and responsibility

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Whether training AI on COPYRIGHTED WORKS without permission is legal is STILL UNSETTLED in the United States. A key question is FAIR USE, a legal doctrine weighing purpose, the nature of the work, how much was used, and the effect on the market. In June 2025, two federal district judges in California (Bartz v. Anthropic; Kadrey v. Meta) found training on the books at issue was fair use on those records, with important limits. The US Copyright Office's May 2025 report said the answer depends on the facts. Many other cases are pending.

Is training AI on copyrighted works without permission settled law in the US?

A. Yes, it is always legal
B. Yes, it is always illegal
C. No; it is still unsettled
D. Yes

Breaking terms can lead to losing access or other contract consequences. Laws still apply on top of any contract.

Prepared example (fictional terms of service)

Terms of Service (excerpt): "You own the outputs you create, to the extent permitted by law. You may not use the service to impersonate others or to make decisions about credit or employment without human review. We may use your inputs to improve our services unless you opt out in Settings."

In the same excerpt, how can a user stop inputs being used to improve services?

A. Opt out in Settings
B. Delete the app
C. Write to Congress
D. Nothing can be done

REFERENCE LABEL: NOT PART OF THE QUESTION ID S131-M-Q4
Artificial Intelligence, Set 131: Provider terms and licenses · MAIN · Q4/5 · Outcome AI.LAW.04 (local)

Learn
Every AI tool comes with TERMS: terms of service, usage policies and sometimes a separate LICENSE. These are CONTRACTS between you and the provider, not laws, but they bind you once you agree. Look for: who OWNS or may use the OUTPUTS; what uses are PROHIBITED (for example, certain high-risk or deceptive uses); whether your INPUTS may be used to improve the service; ATTRIBUTION or disclosure requirements; and how the provider may CHANGE the terms. Breaking terms can lead to losing access or other contract consequences. Laws still apply on top of any contract.

Do laws still apply on top of a contract?

A. No, because agreeing to a contract replaces every law that would otherwise apply to the user

B. Only for businesses

C. Only in some countries

D. Yes

When reading AI terms, look for five points. (1) OUTPUTS: who owns or may use them? (2) PROHIBITED USES: what is not allowed? (3) INPUTS: may they be used to improve the service, and can you opt out? (4) ATTRIBUTION: must you credit the tool or disclose AI use? (5) CHANGES: how can the provider change the terms? Example sentence: "You must label AI-generated images as such when publishing them." That is point 4.

"We may update these terms with 30 days' notice" is which point?

A. Outputs, since the notice period decides who owns the content that users create

B. Inputs

C. Changes

D. Prohibited uses

Set 132: Likeness and voice

Outcome AI.LAW.05: Explain likeness and voice rights and consent using dated state and federal examples

Module: Society: law, policy and responsibility

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Your LIKENESS (face, image) and VOICE identify you, and some laws protect them, often through a RIGHT OF PUBLICITY that limits commercial use without consent. Examples, each dated: Tennessee's ELVIS Act (effective July 1, 2024) added voice, including simulated voice, to that state's publicity rights. The US Federal Communications Commission ruled in February 2024 that AI-generated voices in calls need the same prior consent as other artificial voices. The federal TAKE IT DOWN Act (2025) requires covered platforms, from May 19, 2026, to remove nonconsensual intimate images, including AI-generated ones, within 48 hours of a valid request.

What does a right of publicity typically limit?

A. Use of public parks
B. Use of software
C. Any mention of a person's name in any news story
D. Commercial use of someone's identity without consent

REFERENCE LABEL: NOT PART OF THE QUESTION ID S132-M-Q1

Which practice is safe regardless of the exact rule?

A. Never telling viewers

B. Getting consent and labeling synthetic media

C. Using anyone's likeness, as long as the use is in a state that has no publicity law

D. Using famous people only

REFERENCE LABEL: NOT PART OF THE QUESTION ID S132-F2-Q2
Artificial Intelligence, Set 132: Likeness and voice · FORWARD 2: HANDLE THE COMPLICATIONS · Q2/5 · Outcome AI.LAW.05 (local)

Learn
Coverage varies. Publicity rights differ by state; some protect only commercial uses, some extend after death, some cover voice explicitly. Parody, news and commentary may be treated differently, and courts are still applying older laws to new technology. The safe practice does not depend on the exact rule: get consent to use someone's likeness or voice, label synthetic media, and never create sexual or deceptive content about real people.

Are courts still applying older laws to new technology?

A. Only in Europe

B. Courts ignore technology

C. Yes

D. No, every question about AI and likeness was fully answered by courts before 2020

REFERENCE LABEL: NOT PART OF THE QUESTION ID S132-F2-Q3

Set 133: Privacy rules

Outcome AI.LAW.06: Recognize privacy rules that can apply to data used with AI, with dated US and EU examples

Module: Society: law, policy and responsibility

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Privacy rules can apply to data used with AI. Two dated examples. In the United States, the Children's Online Privacy Protection Rule (COPPA) covers personal information collected online from children under 13; the Federal Trade Commission (FTC) amended it in 2025, with most compliance required by April 22, 2026. In the European Union, the General Data Protection Regulation (GDPR, since 2018), in Article 22, gives people a right not to be subject to decisions based SOLELY on automated processing with legal or similarly significant effects, with stated exceptions and safeguards. Rules differ by place.

Whose information does COPPA cover?

A. Only businesses
B. Only teachers
C. Every adult who uses the internet
D. Children under 13, collected online

REFERENCE LABEL: NOT PART OF THE QUESTION ID S133-M-Q1

Learn
Privacy rules usually ask similar questions: What personal data is collected? For what purpose? Did people consent or get notice? Who receives it? How long is it kept? Many US states have their own privacy laws, and sector laws cover areas such as health and education records. When an AI project uses personal data, collect only what is needed, tell people, protect it, and check which rules apply where you are. This is general information, not legal advice.

Besides COPPA, what other kinds of US privacy rules exist?

A. Only company terms

B. None, because COPPA is the only privacy rule that exists anywhere in the United States

C. Only EU rules

D. State privacy laws and sector laws

Using AI does not switch off ANTI-DISCRIMINATION and NOTICE rules. Dated examples. New York City Local Law 144 (enforced from July 5, 2023) lets employers use an automated employment decision tool only after an independent BIAS AUDIT within the past year, with a public summary and advance notice to candidates. Illinois amended its Human Rights Act, effective January 1, 2026, to bar discriminatory AI use in employment and require notice. For credit, the US Consumer Financial Protection Bureau (CFPB) said in Circular 2023-03 that lenders must give SPECIFIC reasons for denials even when they use complex algorithms.

A NYC employer uses an AI résumé screener without a bias audit in 2024. What is the issue?

A. It violates COPPA
B. It violates the ELVIS Act
C. It may violate Local Law 144
D. Nothing

A rejected applicant wants to know if AI was used. What can they do?

A. Post insults

B. Hack the company

C. Nothing, because applicants have no way to ask any company about its hiring process

D. Ask what was used and why

REFERENCE LABEL: NOT PART OF THE QUESTION ID S134-F1-Q5
Artificial Intelligence, Set 134: Discrimination rules and automated decisions · FORWARD 1: APPLY IT · Q5/5 · Outcome AI.LAW.07 (local)

Learn
These rules share themes: test for bias, tell people when automated tools are used, and be able to explain decisions. Details and coverage differ by place and sector, and agency guidance can be revised or withdrawn, so check the current status. "The algorithm decided" is not a defense that removes responsibility from the organization using it. People affected can ask what was used and why, and may have rights to complain or appeal.

Which themes do these rules share?

A. Lower prices

B. Testing for bias, notice and explaining decisions

C. Faster hiring

D. Banning computers from workplaces and requiring all decisions to be made on paper by hand

REFERENCE LABEL: NOT PART OF THE QUESTION ID S134-F2-Q1

Set 135: Deceptive AI claims and consumer protection

Outcome AI.LAW.08: Recognize deceptive claims about AI products and fake AI-written reviews as consumer-protection issues

Module: Society: law, policy and responsibility

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
Consumer-protection laws forbid DECEPTIVE claims, and they apply to AI products too. In September 2024, the US Federal Trade Commission (FTC) announced "Operation AI Comply": five actions under EXISTING law, including against a company marketing a "robot lawyer" whose claims were alleged to be untested, a tool alleged to help generate FAKE REVIEWS, and schemes promising quick earnings from AI-powered online stores. Two lessons: claims about what AI can do must be truthful and supported, and AI-written fake reviews are deceptive like any fake review.

Do consumer-protection laws apply to AI products?

A. Only to physical products

B. Yes

C. No, because AI is a new technology that existing consumer laws were never written to cover

D. Only in Europe

Set 136: School and workplace policies, disclosure and records

Outcome AI.LAW.09: Follow a written AI policy, disclose AI help where required and keep records

Module: Society: law, policy and responsibility

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn

Schools and workplaces often have WRITTEN AI POLICIES. Read yours: which tools are APPROVED, which uses are allowed (brainstorming, editing, coding help), which are not (submitting AI work as your own, entering private data), and whether you must DISCLOSE AI help and how. Keep RECORDS when required, such as saved drafts or a note of how AI was used. Policies differ between classes, schools and employers. In the US, the Department of Education issued guidance in July 2025 about using federal grant funds for some AI uses; it is guidance about funding, and schools still set their own AI policies.

Prepared example (a fictional class policy)

Class AI Policy (excerpt): "You may use approved AI tools to brainstorm and to check grammar. You may not submit AI-written paragraphs as your own. If you use AI, add a one-line note at the end saying how."

In this fictional policy, which use is allowed?

A. Submitting a paragraph written by an AI tool as if the student had written it personally

B. Brainstorming with an approved tool

C. Using any tool at all

D. Skipping the note

REFERENCE LABEL: NOT PART OF THE QUESTION ID S136-M-Q1

Schools and workplaces often have WRITTEN AI POLICIES. Read yours: which tools are APPROVED, which uses are allowed (brainstorming, editing, coding help), which are not (submitting AI work as your own, entering private data), and whether you must DISCLOSE AI help and how. Keep RECORDS when required, such as saved drafts or a note of how AI was used. Policies differ between classes, schools and employers. In the US, the Department of Education issued guidance in July 2025 about using federal grant funds for some AI uses; it is guidance about funding, and schools still set their own AI policies.

What was the US Department of Education's July 2025 guidance about?

A. Banning AI in schools
B. Teacher salaries
C. A national rule that every classroom must follow
D. Using federal grant funds for some AI uses

REFERENCE LABEL: NOT PART OF THE QUESTION ID S136-M-Q5

Learn
Some math tests allow CALCULATORS; others do not, and some allow only basic ones. A student who uses a graphing calculator on a "no calculator" test breaks the rule, even if calculators are allowed elsewhere. Teachers may also ask students to "show your work." AI policies work the same way: what is allowed depends on the class or job, and showing your work is like disclosing AI help and keeping records.

Are calculators allowed on every test?

A. Only on Fridays

B. No; it depends on the test

C. Never

D. Yes, calculators are allowed on every test in every class in every school, always

When a policy is unclear or silent, ask before you act, and keep the answer in writing if possible. A policy for one class may not apply in another, and policies change over time. Disclosure is easier when you keep records as you go: drafts, prompts used, and what you changed. If you realize you broke a policy, telling the teacher or manager promptly is usually better than hoping it goes unnoticed.

A policy is unclear. What is the best way to record the answer you get?

A. On social media
B. Nowhere
C. In writing, if possible
D. Only in your memory

Set 137: An international comparison: the EU AI Act

Outcome AI.LAW.10: Describe the EU AI Act's risk-based approach and dated timeline as an international comparison

Module: Society: law, policy and responsibility

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
As an international comparison, the European Union's AI ACT (Regulation (EU) 2024/1689) entered into force on August 1, 2024. It takes a RISK-BASED approach: some practices are PROHIBITED (applying from February 2, 2025); HIGH-RISK systems, such as some used in hiring, education or credit, face requirements like risk management and human oversight; some systems face TRANSPARENCY duties, such as telling people they are interacting with AI. A 2026 amendment, in force July 27, 2026, moved most high-risk obligations for systems listed in its Annex III to December 2, 2027.

When did the EU AI Act enter into force?

A. August 1, 2024
B. December 2, 2027
C. It has not
D. January 1, 2000

How does the US approach mostly differ?

A. It has no rules
B. It copies the EU exactly
C. It relies on existing laws, agencies and state laws
D. It has one single AI law that covers everything

REFERENCE LABEL: NOT PART OF THE QUESTION ID S137-F2-Q2
Artificial Intelligence, Set 137: An international comparison: the EU AI Act · FORWARD 2: HANDLE THE COMPLICATIONS · Q2/5 · Outcome AI.LAW.10 (local)

Learn
Timelines like these change, which is why the course dates every claim and sets a short review interval for this one. The Act applies in the EU, but can affect companies elsewhere that offer AI systems there. Comparing approaches helps: the EU has one broad regulation, while the US mostly relies on existing laws, agency actions and state laws. Neither approach is presented here as right; each reflects different choices and trade-offs.

Does this course say which approach is right?

A. No
B. Yes, it says no rules are needed
C. Yes, it says the US approach is right
D. Yes

Set 138: Responsibility when AI gets it wrong

Outcome AI.LAW.11: Identify the facts needed before deciding who is responsible for an AI error

Module: Society: law, policy and responsibility

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
When AI gets something wrong, deciding who is RESPONSIBLE depends on FACTS: who made the claim to whom, what the user was told, who chose to rely on it, what checks were expected, and what contracts and laws apply. Two dated examples. In Mata v. Avianca (June 2023), a US federal court sanctioned lawyers who filed a brief citing cases that did not exist, made up by a chatbot and not checked. In Moffatt v. Air Canada (February 2024), a Canadian tribunal held an airline responsible for wrong refund information from its website chatbot.

What does responsibility for an AI error depend on?

A. Nothing

B. Only on which company made the AI tool, since tool makers are always responsible for everything

C. Only on the user's age

D. The facts of the situation

REFERENCE LABEL: NOT PART OF THE QUESTION ID S138-M-Q1
Artificial Intelligence, Set 138: Responsibility when AI gets it wrong · MAIN · Q1/5 · Outcome AI.LAW.11 (local)

Artificial Intelligence, Set 138: Responsibility when AI gets it wrong · MAIN · Q5/5 · Outcome AI.LAW.11 (local)

Learn
Before deciding who is responsible for an AI error, gather five facts. (1) WHO made the claim, and to whom? (2) WHAT was the user told about reliability? (3) WHO decided to rely on it? (4) WHAT checks were expected of each person? (5) WHICH contracts and laws apply? Example: a company's chatbot tells a customer a wrong price; the site never warned answers might be wrong; the customer bought based on it. Facts 1-3 point toward the company, but 4 and 5 still need checking.

"A company's chatbot told a customer" answers which fact?

A. Who relied
B. What checks were expected
C. Which laws apply
D. Who made the claim, and to whom

In the United States, AI rules differ by STATE and change quickly. Colorado passed a broad AI law in 2024; it was delayed in 2025, and on May 14, 2026 it was repealed and replaced by a narrower law set to take effect January 1, 2027. At the federal level, Executive Order 14365 (December 11, 2025) directed agencies to challenge some state AI laws and to propose a national framework; an executive order directs federal agencies and does not by itself repeal state laws. To check a rule, find its DATE, current STATUS, and where it APPLIES.

A 2024 article says Colorado's AI Act will take effect in 2026. What should a reader in late 2026 check?

A. The article's author
B. The article's length
C. Its current status
D. Nothing

Because AI rules are changing, a summary can be out of date within months. Use official sources, such as the state legislature's website, and look at the date of any secondary summary. Pay attention to the difference between "signed," "in effect," "delayed," "challenged in court" and "repealed." This course records a checked date and review interval for each such claim so readers know how fresh it is.

Why can a summary of AI rules be out of date within months?

A. The rules are changing quickly

B. Because laws are secret

C. Because paper expires

D. Because summaries are always written incorrectly by people who never read the laws

REFERENCE LABEL: NOT PART OF THE QUESTION ID S139-F2-Q1

Set 140: Reading an argument about AI

Outcome AI.PHIL.01: Identify the conclusion, premises and assumptions of a short argument about AI

Module: Society: philosophy and social questions

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
An ARGUMENT gives reasons for a claim. The CONCLUSION is the claim being argued for. PREMISES are the reasons given. ASSUMPTIONS are unstated beliefs the argument needs. Example: "AI tutors answer questions instantly. Instant answers help students learn. So schools should use AI tutors." Conclusion: schools should use AI tutors. Premises: AI tutors answer instantly; instant answers help learning. Assumption: the answers are accurate and students still think for themselves. To evaluate an argument, ask whether the premises are true and whether they really support the conclusion.

What is the conclusion of an argument?

A. The claim being argued for

B. An unstated belief

C. A reason given

D. The final sentence of any paragraph, whatever that sentence happens to say or do

Learn
In a 1950 paper, "Computing Machinery and Intelligence," Alan Turing suggested replacing the question "Can machines think?" with a test he called the IMITATION GAME. An interrogator exchanges typed messages with a hidden human and a hidden machine and tries to tell which is which. If the machine is hard to tell apart from the human, it does well. This is now often called the TURING TEST. It is debated: doing well shows a machine can produce human-like conversation, but whether that shows thinking or understanding is disputed.

When did Turing publish "Computing Machinery and Intelligence"?

A. 2022, the same year that chatbots first became widely available to the general public

B. 1950

C. 1850

D. 1997

This is now often called the TURING TEST. It is debated: doing well shows a machine can produce human-like conversation, but whether that shows thinking or understanding is disputed.

Is it settled that passing shows thinking?

A. Yes, Turing proved it
B. It cannot be discussed
C. No; it is disputed
D. Yes

Learn
In a 1950 paper, "Computing Machinery and Intelligence," Alan Turing suggested replacing the question "Can machines think?" with a test he called the IMITATION GAME. An interrogator exchanges typed messages with a hidden human and a hidden machine and tries to tell which is which. If the machine is hard to tell apart from the human, it does well. This is now often called the TURING TEST. It is debated: doing well shows a machine can produce human-like conversation, but whether that shows thinking or understanding is disputed.

How do participants communicate in the game?

A. By typed messages
B. By drawing
C. By handshake
D. By video calls

Learn
In a blind taste test, you taste two drinks without seeing labels and guess which is the famous brand. If you cannot tell, the other drink "passes." But passing shows only that it tastes similar to you, in that test. It does not show the ingredients are the same. The imitation game is similar: a machine that is hard to tell from a human in conversation has passed that test, but what that shows about thinking is debated.

In a blind taste test, what are you judging?

A. Which drink has the most expensive bottle and the most attractive label in the store

B. The color of the cup

C. Which drink is which, by taste

D. The price

Set 142: Understanding and the Chinese Room

Outcome AI.PHIL.03: Explain the Chinese Room argument, a main reply, and what remains disputed

Module: Society: philosophy and social questions

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn
In 1980, philosopher John Searle proposed the CHINESE ROOM argument. Imagine a person who does not understand Chinese, in a room with a rulebook. Chinese messages come in; the person follows rules to match symbols and sends back answers that look fluent to people outside. Searle argued the person does not understand Chinese, so following rules to manipulate symbols (SYNTAX) is not by itself understanding (SEMANTICS). A main reply, the SYSTEMS REPLY, says the whole system, room plus rules plus person, might understand. The debate continues.

Who proposed the Chinese Room argument, and when?

A. No one
B. A chatbot, 2022
C. Alan Turing, 1950
D. John Searle, 1980

Set 143: Claims about AI consciousness

Outcome AI.PHIL.04: Evaluate what kinds of evidence a claim that an AI is conscious would need, and why fluent self-reports do not settle it

Module: Society: philosophy and social questions

Course scope: general education for adults and high-school students, not legal, medical or financial advice. No AI tool, account, download or paid service is needed: every example is prepared in advance and shown as text, and nothing runs. Examples labeled "fictional" were written for this course and are not real outputs of any named product. Laws, products and prices change; dated lessons say what to check. People and organizations in scenarios are fictional unless a lesson names a real case.

Learn

Some people claim an AI is CONSCIOUS, meaning it has experiences or feelings. Others say no current AI is. There is no agreed scientific test for consciousness, even for animals, so these claims are hard to settle. One point is widely accepted: a FLUENT SELF-REPORT ("I feel happy," "I am aware") does not settle the question, because language models are trained to produce text like human writing, which is full of such statements. Evaluating a claim means asking what kinds of evidence would count, and noticing when a claim goes beyond the evidence in either direction.

What does "conscious" mean here?

A. Being switched on and connected to electricity, with all of its parts working normally

B. Having experiences or feelings

C. Being fast

D. Being popular

Evaluating a claim means asking what kinds of evidence would count, and noticing when a claim goes beyond the evidence in either direction.

How should you evaluate a consciousness claim?

A. Reject it without thought
B. Ask what kinds of evidence would count
C. Ask the AI to promise
D. Accept it if the AI sounds sincere

REFERENCE LABEL: NOT PART OF THE QUESTION ID S143-M-Q5
Artificial Intelligence, Set 143: Claims about AI consciousness · MAIN · Q5/5 · Outcome AI.PHIL.04 (local)

Learn
A parrot trained to say "I'm hungry!" might say it whether or not it is hungry, because it learned the sound. Hearing it does not tell you about the parrot's stomach; you would look at other evidence, such as when it last ate. A language model saying "I feel happy" is similar in one way: the words come from learned patterns, so the words alone do not show what, if anything, is going on inside.

Why might the parrot say "I'm hungry" when it is not?

A. Because it is cold

B. Because parrots always know exactly what they are saying and never repeat sounds by habit

C. It learned the sound

D. Because it is bored

Learn
ANTHROPOMORPHISM means treating something non-human as if it had human traits: feelings, intentions or loyalty. People do it with pets, cars and computers. In the 1960s, Joseph Weizenbaum at MIT built ELIZA, a simple program that matched keywords and returned scripted replies, yet some users felt it understood them; this is called the ELIZA EFFECT. Modern chatbots are far more fluent, so the pull is stronger. A friendly tone is not evidence of accuracy or care. Set TRUST by EVIDENCE: track record, sources and checks.

What is anthropomorphism?

A. Treating something non-human as if it had human traits
B. Building robots
C. Writing code
D. Studying ancient human history by digging up tools

Anthropomorphism can lead to over-sharing private information, following advice without checking, or feeling betrayed when a tool "forgets." Design choices, such as names, faces, "I" statements and flattering replies, increase the pull. Using friendly language with a tool is fine; the risk is letting the feeling replace judgment. A helpful habit: before acting on advice, ask "Would I trust this if a stranger's website said it?"

Which is a risk of anthropomorphism?

A. Being polite
B. Using fewer emojis
C. Typing faster when talking to a chatbot
D. Following advice without checking
